de Kloet ER, de Jong IE, Oitzl MS (2008). Neuropharmacology of glucocorticoids: focus on emotion, cognition and cocaine. *Eur J Pharmacol.* 585: 473–482. [This review provides a comprehensive overview of glucocorticoids and their potential contributions to a number of neuropsychiatric conditions, including cocaine addiction.]

Graf EN, Hoks MA, Baumgardner J, Sierra J, Vranjkovic O, Bohr C, Baker DA, Mantsch JR (2011) Adrenal activity during repeated long-access cocaine self-administration is required for later CRF-induced and CRF-dependent stressor-induced reinstatement in rats. *Neuropsychopharmacology.* 36: 1444–1454. [This paper demonstrates the importance of elevated glucocorticoids, at the time of excessive cocaine use, for the plasticity that leads to key aspects of addiction, most notably compulsive use.]

Koob GF (2009) Neurobiological substrates for the dark side of compulsivity in addiction. *Neuropsychopharmacology.* 56: 18–31. [This review describes how the recruitment of antireward systems, including CRF, adrenergic and kappa opioid receptors, can contribute to the progression from controlled drug use to addiction.]

Sapolsky RM (2000). Glucocorticoids and hippocampal atrophy in neuropsychiatric disorders. *Arch Gen Psychiatry.* 57: 925–935.

Sinha R, Garcia M, Paliwal P, Kreek MJ, Rounsaville BJ (2006). Stress-induced cocaine craving and hypothalamic-pituitary–adrenal responses are predictive of cocaine relapse outcomes. *Arch Gen Psychiatry.* 63: 324–333. [This paper describes the predictive relationship between HPA axis reactivity and relapse in cocaine-dependent individuals and provides clinical evidence for the importance of the relationship between glucocorticoids and cocaine seeking in preclinical models, as described in this chapter.]
